1 Simplicial complexes

Definition (Simplicial complex). A *simplicial complex* X is a pair (V_X, \mathcal{S}_X) where V_X denotes the vertex set of X and \mathcal{S}_X is the set of *finite, non-empty* subsets of V_X satisfying

1. $\forall v \in V_X$, then $\{v\} \in \mathcal{S}_X$
2. If $\sigma \in \mathcal{S}_X$, $\tau \subset \sigma$, $\tau \neq \emptyset$, then $\tau \in \mathcal{S}_X$.

\mathcal{S}_X is called the set of *simplices* of X .

Example. A *standard 1-simplex*, denoted by Δ^1 is simply the line segment (or usually denoted by I).

$$V_{\Delta^1} = \{0, 1\}$$

$$\mathcal{S}_{\Delta^1} = \{\{0\}, \{1\}, \{0, 1\}\}$$

$$\{0\} \xrightarrow{\{0, 1\}} \{1\}$$

A *standard 2-simplex*, denoted by Δ^2 is the equilateral triangle.

$$V_{\Delta^2} = \{0, 1, 2\}$$

$$\mathcal{S}_{\Delta^2} = \{\{0\}, \{1\}, \{2\}, \{0, 1\}, \{0, 2\}, \{1, 2\}, \{0, 1, 2\}\}$$

In general, the *standard n -simplex* Δ^n , is $\Delta^n = (V_{\Delta^n}, \mathcal{S}_{\Delta^n})$ where

$$V_{\Delta^n} = \{0, 1, \dots, n\}$$

$$\mathcal{S}_{\Delta^n} = \{\alpha : \alpha \subset \{0, \dots, n\}, \alpha \neq \emptyset\}$$

If $X = (V_X, \mathcal{S}_X)$ is a simplicial complex, we now want to pick a field \mathbb{F} , usually \mathbb{Q} or \mathbb{F}_2 (in this course) and want to produce a sequence of vector spaces (over \mathbb{F})

$$C_n(X)_{0 \leq n}$$

$C_0(X)$ is the vector space whose basis elements are simply the vertices of the simplicial complex, and this has dimension 0.

Definition (k -simplex of a simplicial complex). If X is a simplicial complex then a k -simplex of X is a simplex $\sigma \in \mathcal{S}_X$ such that $|\sigma| = k + 1$.

$C_k(X)$ is the vector space whose basis elements are the *oriented k -simplices* of X . If $\{v_0, \dots, v_n\}$ is an n -simplex of X , consider the symbols

$$[v_0, v_1, \dots, v_n]$$

such that

$$[v_{\rho(0)}, v_{\rho(1)}, \dots, v_{\rho(n)}] = \text{sign}(\rho)[v_0, \dots, v_n]$$

Definition.

$$\partial_n : C_n(X) \rightarrow C_{n-1}(X)$$

is a linear map defined on basis elements as follows;

$$\partial_n[v_0, \dots, v_n] = \sum_{r=0}^n (-1)^r [v_0, \dots, \hat{v}_r, \dots, v_n]$$

where \hat{v}_r indicates omission of v_r .

Example.

$$\begin{aligned}\partial_2[0, 1, 2] &= [1, 2] - [0, 2] + [0, 1] \\ \partial_1[v_0, v_2] &= [v_1] - [v_0]\end{aligned}$$

$$\begin{aligned}\partial_1\partial_2[0, 1, 2] &= \partial_1([1, 2] - [0, 2] + [0, 1]) \\ &= ([2] - [1]) - ([2] - [0]) + ([1] - [0]) \\ &= 0\end{aligned}$$

Proposition (Poincaré lemma). Let X be a simplicial complex. Consider

$$\partial_r : C_r(X) \rightarrow C_{r-1}(X)$$

for $r \geq 1$, then

$$\partial_{n-1}\partial_n \equiv 0$$

Proof.

$$\partial_n[v_0, \dots, v_n] = \sum_{r=0}^n (-1)^r [v_0, \dots, \hat{v}_r, \dots, v_n]$$

$$\begin{aligned}\partial_{n-1}[v_0, \dots, \hat{v}_r, \dots, v_n] &= \sum_{s < r} (-1)^s [v_0, \dots, \hat{v}_s, \dots, \hat{v}_r, \dots, v_n] \\ &\quad + \sum_{s > r} (-1)^{s-1} [v_0, \dots, \hat{v}_r, \dots, \hat{v}_s, \dots, v_n]\end{aligned}$$

$$\begin{aligned}\partial_{n-1}\partial_n[v_0, \dots, v_n] &= \sum_{s < r} (-1)^{r+s} [v_0, \dots, \hat{v}_s, \dots, \hat{v}_r, \dots, v_n] \\ &\quad + \sum_{s > r} (-1)^{r+s-1} [v_0, \dots, \hat{v}_r, \dots, \hat{v}_s, \dots, v_n] \\ &= 0\end{aligned}$$
